

Questions

- In `01_OpenScience_RawData.csv`, line 98: in `Materialsused`, `TOP_4Materials_8` is omitted, is it intentional? (I added it back in the cleaned one).
- The frequencies and percentages in RQ1 can be simplified by using helper functions (just like the one used in RQ4), but only to make it look more succinct, not really necessary.
- With only `01_OpenScience_RawData.csv` (numeric version), the output of RQ1 (frequencies and percentages) only return numbers. With codebook, I assume it is not a problem? But if we still want to show the labels, I can add a few lines to recode it with `factor()`.

Changes made

Data Loading

- **Removed:** Loading of `01_OpenScience_RawDataLabels.csv` (label version)
- **Changed:** Now uses only `01_OpenScience_RawData.csv` (numeric version) throughout
- **Removed:** The separate `data_rawnum` dataset; all operations now use single `data_raw`
- **Removed:** `library(haven)` because no `.sav` file is used.
- **Added:** `library(gmodels)` because it is necessary for the function `CrossTable` used in line 474 in the original R script.

Merge

- **Removed:** The merge step (`merge(data_raw, data_rawnum[...])`) since only one dataset is used
- **Removed:** `data_rawnum` row from `summary_table_compositesc` output

RQ3

- **Changed:** Uses a lookup vector (`method_labels`) with numeric codes instead of `recode()` with text labels
- **Changed:** Direct numeric-to-label mapping rather than text pattern matching

RQ4

- **Added:** Helper function `get_pct()` to extract percentages by numeric code
- **Changed:** Uses numeric codes (1, 2, 3, 4, 5, 6, 7) instead of text labels for table lookups
- **Improved:** Returns 0 if value is NA (cleaner handling)

Formatting / comments

- **Added:** Detailed methodology comments explaining composite TOP score calculation
- **Added:** Section headers
